FAN7527B

Power Factor Correction Controller

Features

- Internal Start-up Timer
- Internal R/C Filter Eliminates the Need for an External R/C Filter
- Very Precise Adjustable Output Over Voltage Protection
- Zero Current Detector
- One Quadrant Multiplier
- Trimmed 1.5% Internal Band Gap Reference
- Under Voltage Lockout with 3V of Hysteresis
- Totem Pole Output With High State Clamp
- Low Start-up and Operating Current
- 8-Pin DIP or 8-Pin SOP

Applications

- Electronic Ballast
- SMPS

Description

The FAN7527B provides simple and high performance active power factor correction. The FAN7527B is optimized for electronic ballasts and low power and high density power supplies which require minimum board size, reduced external components and low power dissipation. Because the R/C filter is included in the current sense block, the external R/C filter is not necessary. Special circuitry has also been added to prevent no load runaway conditions. Regardless of the supply voltage, the output drive clamping circuit limits the overshoot of the power MOSFET gate drive. It greatly enhances the system reliability.

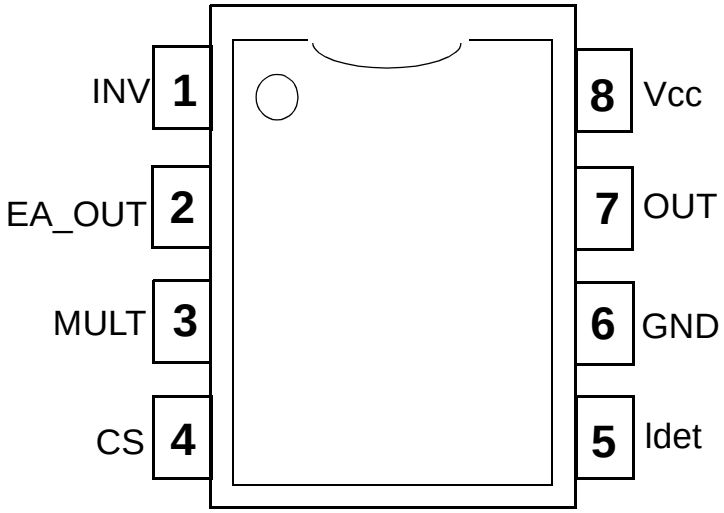
PIN Description



(Top View)

Pin Number	Pin Name	Pin Function Description
1	INV	Inverting input of the error amplifier. The output of the boost converter should be resistively divided to 2.5V and connected to this pin.
2	EA_OUT	The output of the error amplifier. A feedback compensation network is placed between this pin and the INV pin.
3	MULT	Input to the multiplier stage. The full-wave rectified AC voltage is divided to less than 2V and is connected to this pin.
4	CS	Input of the PWM comparator. The MOSFET current is sensed by a resistor and the resulting voltage is applied to this pin. An internal R/C filter is included to reject any high frequency noise.
5	Idet	Zero current detection input.
6	GND	The ground potential of all the pins.
7	OUT	Gate driver output. The push pull output stage is able to drive the Power MOSFET with peak current of 500mA.
8	Vcc	Supply voltage of driver and control circuits.
